AUTHORIZATION STATEMENT

I, Taghreed Bakheet Al-Nawafleh, authorize Isra University to supply hard and electronic copies of my thesis to libraries, establishment, or bodies and institutions concerned with research and scientific studies upon request, according to the university regulations.

Date:

Signature:

DEDICATION

I dedicate my dissertation work to my mother's soul, my father and my family members.

I dedicate this work and give special thanks to William, Elias and Tala who made it possible for me to complete it.

I also dedicate this dissertation to my best friend Tahreer Al-Nawaiseh for being there for me throughout the last 15 years and to my lovely nephew Dr. Asem Al-nawafleh you have been my best cheerleaders.

ACKNOWLEDGEMENT

First and foremost all thanks belong to Allah

I am extremely grateful and would like to thank my supervisor

Prof. Ahmad Naddaf

I sincerely thank him for his invaluable guidance, continuous advice and support through the time spent in accomplishing this work.

I would like to express deepest gratefulness and sincere appreciation to all committee members, who will enrich my thesis with their valuable opinions and comments.

I would like to thank Dr. Amjad Abu-Rmelh, the Dean of the faculty of Pharmacy at Isra University and to the faculty staff for their help and support.

I really appreciate the assistance of Dr. Fayez Abu Joudeh, the general administrator of QRH, and the technician Fayzeh Elrawadeh.

**RISK FACTORS AND PREVALENCE OF HYPOTHYROIDISM IN PETRA
REGION SOUTH OF JORDAN**

By:

Tagreed Bakheet H. Al-Nawafleh

Supervisor:

Prof. Ahmad Naddaf

ABSTRACT

Hypothyroidism is the second most important endocrine disorders, and its prevalence reaches 7% worldwide. There are many etiologies of hypothyroidism, and where a low knowledge coupled with inadequate health literacy may lead to poor disease control, prevention and adherence. This study aimed to explore the main etiology of hypothyroidism at Petra region, and measure patients' knowledge, awareness and practice (KAP) according to the hypothyroidism and adherence to treatment.

A cross-sectional study was conducted at Queen Rania Hopital. Hypothyroidism participants (n=150), aged ≥ 18 years, from Petra, responded to the validated questionnaires. Blood samples were collected to measure antithyroid antibodies. A total of 150 participants completed the questionnaire. The median age of the participants was 41.5 ± 13.5 years; with the majority being females (92.7%). Blood analysis showed that 62.7% of the sample had positive antithyroid antibodies which are the highest prevalent risk factor in the region, the life style and iodine intake as second risk factors, 62% of patients had a family history and 20.1% of females diagnosed during pregnancy or postpartum. Also, other diseases

showed high risk such as diabetes (22.7%) and vitamin D3 deficiency (36%). According to the total score of KAP majority of the sample had poor and low level of knowledge and awareness regarding hypothyroidism. In addition to, 82% of participants were adherent to thyroxine, and the proportion of patients whose thyroid hormonal level was controlled was 56.7%. This study concluded that a large number of patients were lacking basic knowledge about hypothyroidism and they had dietary and treatment-related misconceptions, which may affect disease controlling and adherence to treatment. Thus, health care providers should educate and counsel patients in order to improve their knowledge regarding disease and adherence. The most prevalent etiologies of hypothyroidism are female gender, autoimmunity (Hashimoto's), family history, the geographical region of Petra, life style and poor iodine intake.
