

**Time and Speed Management to Coordinate
Signalized Intersections in Arterial Urban Street
(Case Study)**

Prepared by

Ali Abdulrahman Ihsan

Supervised by

Prof. Dr. Basim K. Jrew

A Thesis

**Submitted to Faculty of Engineering as a Partial Fulfilment of the
Requirements for Master Degree in Engineering Project Management**

November, 2018

Acknowledgment

Thank you, God for giving me the strength and ability to learn, understand and complete thesis. I would like to express my sincere gratitude to my supervisor Prof. Dr. Basim Jrew for his patience, motivation and guiding me. A special thanks to Dr. Majed Msallam for the continuous supporting, supervising, helping and advising me all these months, I am totally grateful. Without they precious support it would not be possible to make this thesis done. A special thanks to my family especially my father, words cannot express how grateful I am.

Isra University

Authorization form

I'm, Ali Abdulrahman Ihssan, authorize the Isra University to supply copies of my thesis to the libraries or establishment or individuals on request, according to the Isra University regulations.

Time and Speed Management to Coordinate Signalized Intersections in Arterial Urban Street (Case Study)

By

Ali Abdulrahman Ihssan

Supervisor

Prof. Dr. Basim K. Jrew

ABSTRACT

Amman city has the highest proportion of automobile ownership in Jordan, with highest level of congestion. Due to the high automobile dependency, the congestion is increasing dramatically, this situation calls for an urgent solution. Many solutions can be done to reduce congestion levels and improve the traffic flow conditions, this solution is varying among the implementation cost. Although the lower-cost solutions would be more acceptable for decision-makers due to the limited budget.

This study aims to apply a coordination system on one of the dynamic arterials in Amman which is Al-Hurriyeh street, which have six signalized intersections with very traffic congestion.

SYNCHRO-10, SIM TRAFFIC-10 and PASSER II software programs were used to evaluate, optimize, simulate, and coordinate by using leading and lagging left turn phasing the signalized intersections. the measure of effectiveness (MOEs) such as delays, stops and travel time that are using to managing the time and speed thru coordinate the selected signalized intersections for the year 2018 and the year 2023 with growth factor 5.5%.

The result shows that the coordination of the selected traffic signalized intersections of arterial urban street are 62% better than before coordination, also the result shows that the intersections delay isolated after coordination are improved for 58,5% before coordination, and for entire network the total delay, stops, travel time, fuel consumption and air pollution were reduced 42%, 11%, 28%, 19%, 19% respectively, and the saving after coordination for the next five years is 895950 JD in the peak hour for the workdays. The level of service (LOS) for all intersections has been improved after coordination. Based on the clear improvements of this study it is highly recommended to apply the suggested coordination system since it's the lower implementation cost of any solutions.

Keywords: Coordination, Optimization, measure of effectiveness (MOEs), level of service (LOS), Delay, Stops, Travel time, Fuel consumption, Air pollution.
